TOTAL HALOACETIC ACIDS (HAA5) (7)	LRAA(2014) 27 ppb Range (23–33 ppb)	60 ppb	0 ppb By-product of drinking water chlorination.
TOTAL TRIHALOMETHANE (TTHM) (7)	LRAA(2014) 28 ppb Range (20–36.7 ppb)	80 ppb	0 ppb By-product of drinking water chlorination.

Definitions:

Maximum Contaminant Level (MCL): The highest level of a contaminant that is allowed in drinking water.

Maximum Contaminant Level Goal (MCLG): The level of a contaminant in drinking water below which there is no known or expected risk to health.

Running Annual Average (RAA): The Average of all monthly or quarterly samples for the last year at all sample locations.

Action Level (AL): The concentration of a contaminant that, if exceeded, triggers treatment or other requirements that a water system must follow.

Maximum Residual Disinfectant Level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG): The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water.

Units:

 $ppm = parts \ per \ million \ or \ milligrams \ per \ liter \ (mg/L). \\ ppb = parts \ per \ billion \ or \ micrograms \ per \ liter \ (\mu g/L). \\ pps = positive \ samples. \\ problem PL = million \ fibers \ per \ liter \ (\mu g/L). \\ problem PCi/L = piccouries \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ MFL = million \ fibers \ per \ liter \ (a \ measure \ of \ radioactivity). \\ pos = positive \ samples. \\ pos = posi$

Notes

- 1) Total Coliform Bacteria: Reported as the highest monthly number of positive samples, for water systems that take less than 40 samples per month.
- 2) Fluoride: For those systems that fluoridate, fluoride levels must be maintained between 0.5 to 1.2 ppm. The optimum level is 0.7 ppm.
- 3) Lead/Copper: Action levels (AL) are measured at consumer's tap. 90% of the tests must be equal to or below the action level.
- 4) Nitrate: Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant you should ask advice from your health provider.
- 5) Gross Alpha: Action level over 5 pCi/L requires testing for Radium 226 and 228. Action level over 15 pCi/L requires testing for Uranium. Compliance is based on Gross Alpha results minus Uranium results = Net Gross Alpha.
- 6) Radon: The State of Maine adopted a Maximum Exposure Guideline (MEG) for Radon in drinking water at 4000 pCi/L, effective 1/1/07. If Radon exceeds the MEG in water, treatment is recommended. It is also advisable to test indoor air for Radon.
- 7) TTHM/HAA5: Total Trihalomethanes and Haloacetic Acids (TTHM and HAA5) are formed as a by-product of drinking water chlorination. This chemical reaction occurs when chlorine combines with naturally occurring organic matter in water. Compliance is based on running annual average.

All other regulated drinking water contaminants were below detection levels.

Health Information

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production and can also come from gas stations, urban runoff, and septic systems.

Radioactive Contaminants, which can be naturally-occurring or be the result of oil and gas production and mining activities.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline (1-800-426-4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing.

Violations

No Violations in 2014

Waiver Information (to be included in the CCR for systems that were granted a waiver)

No Water Testing Waivers in 2014

Certification		
I hereby certify	y and attest that I have	distributed copies of this Consumer Confidence
Report to all users of my public water system of	on	, by mail, posted in the newspaper
or electronically ,(check one) in accordance	e with 40 CFR§141-142	2. I further certify that the information contained
in this annual Consumer Confidence Report is	correct and consistent v	with compliance monitoring data. Any
intentional deception or misinformation representation	ented in this report may	be cited as a violation of State and U.S. EPA
National Primary Drinking Water Rules.		
Signed:	Dated:	

Instructions: Please complete this CCR template (fill in the blanks) with all pertinent information or use the information provided in this template to create your own CCR report. Distribute copies of this CCR to all customers or residents served by this water supply as well as to the State of Maine Drinking Water Program by July 1st. Also send a signed and dated (Certification) CCR to the DWP for our records by October 1st. If you have provided the CCR electronically please provide documentation on how consumers were notified as well as the direct link to the CCR on the internet. If the CCR was provide via e-mail please provide a sample copy of the e-mail with the embedded or attached CCR. Should you have any questions, contact your Compliance Officer at the DWP, telephone: 207-287-
